

Group A Diary — 19.05.2026 - 27.05.2026

Backend Team: Andrejs Grisin, Vitalina Alipova, Anastasia Petrova, Alan Kurilov

Frontend Team: Igor Sieradzki, Anca Morosan, Arushee Kumar, Kunal Sharma

Backend Team

Anastasia focused on user management and authentication-related functionality. She implemented the PUT /users/me endpoint, allowing authenticated users to update their profile information. In addition, she developed unit tests for the registration and login functionality to improve backend reliability and ensure correct authentication behaviour.

Vitalina continued work on the automated trading subsystem. Her contributions included implementation of the following endpoints:

- POST /auto-trades
- GET /auto-trades
- DELETE /auto-trades/{id}

She also implemented the automated trade execution logic, allowing active auto-trades to be periodically checked and executed once price conditions are met.

Andrejs focused on deployment and infrastructure improvements. He resolved Redis-related dependency issues, corrected package requirement conflicts, fixed structural issues within the backend project setup, and worked on restoring Docker compatibility after environment-related problems.

Alan continued work on stock data processing and backend automation. His contributions included implementation of a cron job that updates price_history for all stock tickers currently present in user portfolios. He also implemented the GET /stocks/popular endpoint, which returns the top 20 stock tickers, and introduced parallel stock price requests to improve efficiency of stock data retrieval.

Frontend Team

Igor focused on profile-related functionality, user notifications, and frontend coordination. His tasks included implementation of:

- a warning banner shown when a user's net worth falls below \$500
- the /profile page with user information, statistics, and profile editing functionality
- mobile responsiveness checks for all frontend pages at 375px screen width
- debugging and resolving mobile layout issues

maintaining a frontend bug list in Coda and coordinating issue resolution across the frontend team. He will finish all the assignments until Thursday.

Anca focused on frontend design consistency and interface improvements. Her tasks included:

- UI polish across the application
- improving consistency of colors, spacing, and typography
- implementing loading skeletons for all data-fetching pages
- integrating icons via lucide-react

Her work improved the overall visual consistency and user experience of the frontend. She will finish all the assignments until Thursday.

Kunal worked on automated trading frontend functionality and error handling. His contributions included:

- implementation of the /auto-trades frontend page
- functionality for listing, creating, and deleting auto-trades
- implementation of a yellow TEST_MODE warning banner

He will finish all the assignments until Thursday.

Arushee focused on public portfolio access, leaderboard integration, and data export functionality. She implemented a new dynamic frontend route:

- /users/:id/portfolio

This allows users to view public portfolios without authentication. The implementation uses Vue Router route parameters to read the user ID directly from the URL and display portfolio-related information such as the net worth chart and trades table. At this stage, temporary frontend mock data is still used until backend portfolio APIs are fully connected.

In addition, she implemented:

- CSV export functionality for filtered trades (trades.csv)
- integration of LeaderboardTable.vue into the leaderboard page

Summary

During this reporting period, the team made substantial progress toward completion of core platform functionality. Backend development advanced in authentication, automation, infrastructure stability, and stock data processing, while frontend development focused on user experience, automated trading interfaces, public portfolio access
